COUNTY: DORSET SITE NAME: SOUTH DORSET COAST

DISTRICT: Purbeck, West Dorset, Weymouth and Portland

Status: Site of Special Scientific Interest (SSSI) notified under Section 28 of the Wildlife and Countryside Act 1981, as amended.

Local Planning Authority: PURBECK DISTRICT COUNCIL, West Dorset District Council, Weymouth & Portland Borough Council, Dorset County Council

National Grid Reference: SY 697816–SZ 040786	Area: 1760.9 (ha.) 4351.2 (ac.)
Ordnance Survey Sheet 1:50,000: 194, 195	1:10,000: SY 78 SW, SE; 87 NW; 88 SW, SE; 87 NE; 97 NE; SZ 07 NW
Date Notified (Under 1949 Act): 1952	Date of Last Revision: 1977
Date Notified (Under 1981 Act): 1986	Date of Last Revision: –

Other Information:

Formerly notified as Bowleaze Cove to Peveril Point SSSI. Within A.O.N.B. and part of the Dorset Heritage Coast. Parts are owned by the National Trust. Site amended by extension and deletion. More detailed geological and biological information is available on request.

Description

This stretch of coastline combines internationally important geological interest with a rich range of wildlife habitats supporting populations of several rare plants and animals.

The coastal cliffs are of international geological importance and expose a complete section through the Upper Jurassic and Cretaceous rock succession. The site includes the type localities for the Kimmeridge Clay, the Kimmeridgian Stage, the base of the Portlandian Stage and the Purbeck Beds as well as the standard reference section for the Oxfordian of southern England. Numerous features of great importance for studies of Palaeontology, sedimentology, stratigraphy and environments of rock formation are present and have been studied by geologists for well over 150 years. The site is also of national importance for its physiographic interest.

Most of the rock units are very fossiliferous and a number are of international significance for the assemblages of fossil vertebrates which they contain. In particular the Purbeck Beds of Durlston Bay are of special note since they have yielded one of the most important collections of Mesozoic mammals from anywhere in the world. Durlston is also the most important Late Jurassic–Early Cretaceous fossil insect site in Europe. Internationally important sites for fossil reptiles also occur in the Kimmeridge Clay at Gaulter Gap to Broad Bench and between Swyre Head and Chapmans Pool and in the Oxford Clay at Furzy Cliff.

The great range of rock types has given rise to a varied coastline of vertical cliffs, undercliffs and landslips which support an outstanding array of local and maritime species. Among the rare plants which occur here are the Carrot Broomrape *Orobanche maritima* and the strongest national populations of Wild Cabbage *Brassica oleracea*.

The majority of unimproved limestone grassland in Dorset falls within this site which also includes one of the main areas of unimproved chalk grassland in the county. The character of these calcareous grasslands is strongly influenced by their maritime location and also very locally there is 'chalk heath' on clay with flints over the chalk. Among the many scarce and localised plants and animals of the chalk and limestone are the largest national populations of two rare species -- Early Spider Orchid *Ophrys sphegodes** and Lulworth Skipper butterfly *Thymelicus acteon*.

Unimproved grassland, scrub and woodland typical of more neutral soils are found on the clays and sands of the Wealden, the Kimmeridge, Oxford and Gault Clays and the Reading Beds. Of the woodlands, those of the Tyneham Valley are especially notable for their lichen communities which include several rare species.

*This species is given special protection under Section 13 of the Wildlife and Countryside Act 1981.

County: Dorset Site Name: Blashenwell Farm Pit

District: Purbcck

Status: Site of Special Scientific Interest (SSSI) notified under Section 28 of the Wildlife and Countryside Act 1981 (as amended).

Local Planning Authority: Purbeck District Council, Dorset County Council

National Grid Reference: SY 952805	Area: 11.4 (ha) 28.2 (ac)
Ordnance Survey Sheet 1:50,000: 195	1:10,000: SY 98 SE
Date Notified (Under 1949 Act): 1954	Date of Last Revision: -
Date Notified (Under 1981 Act): 1988	Date of Last Revision: –

Other Information:

A Geological Conservation Review Site. Site boundary amended by extension.

Description and Reasons for Notification:

The tufa deposit at Blashenwell Farm is important for Quaternary studies, providing a detailed record of molluscan biostratigraphy and environmental history during the early- and mid-Flandrian (mollusc assemblage zones b to d). It is particularly valuable for the length and continuity of the record and the dating potential provided by the presence of associated archaeological remains. Several radiocarbon dates are also available from the site.

Notified to the Secretary of State on 12 Feb 88

COUNTY: DORSET SITE NAME: CORFE COMMON

DISTRICT: PURBECK

Status: Site of Special Scientific Interest (SSSI) notified under Section 28 of the Wildlife and Countryside Act 1981, as amended

Local Planning Authority: PURBECK DISTRICT COUNCIL

National Grid Reference: SY 960810	Area: 88.6 (ha.) 218.9 (ac.)
Ordnance Survey Sheet 1:50,000: 195	1:10,000: SY 98 SE
Date Notified (Under 1949 Act): 1972	Date of Last Revision:1977
Date Notified (Under 1981 Act): 1984	Date of Last Revision: –
Other Information:	

Registered as Common Land.

Reasons for Notification:

Lying immediately south of the village of Corfe Castle, and flanked to the south and west by a branch of the Corfe River, the Common is the only large remaining area of uncultivated land on the Purbeck Wealden Beds. It is of great botanical interest, the flora of the flushes being of particular richness.

There is a central east-west ridge of Wealden Sandstone and the lower land is Wealden Clay bearing a series of flushes particularly along the western margin. The varied hydrology of the site and its long history as common land have contributed to the great variety and richness of its flora.

The sandstone ridge has swards dominated by bent grasses *Agrostis* spp. and stands of bracken *Pteridium*. Bristle Bent *Agrostis curtisii*, Bluebell *Hyacynthoides non-scriptus* and Saw-wort *Serratula tinctoria* are frequent and Ling *Calluna vulgaris* and Bell Heather *Erica cinerea* also occur. Lower ground supports close-grazed swards with Purple Moor-grass *Molinia caerulea* and Soft Rush *Juncus effusus* locally dominant. The flushes typically occupy short narrow valleys and their upper parts have a vegetation characterised by several species of pleurocarpus mosses, for example *Drepanocladus fluitans* and *Campylium stellatum*. Wherever drainage is impeded, communities dominated by a variety of *Sphagnum* species are found. Amongst the range of higher plants are Bog Asphodel *Narthecium ossifragum*, Bottle Sedge *Carex rostrata*, Bog Bean *Meneanthes trifoliata*, Cotton Grass *Eriophorum angustifolium*, Marsh Arrow Grass *Triglochin palustris* and Pale Butterwort *Pinguicula lusitanica*.

The wetter areas support an extremely varied and interesting fauna including a number of local and rare species. Notable among these are several beetles: the very local Tortoise Beetles *Cassida murraea* and *C. vibax*, the Water-Jewel

Beetle *Plateumaris discolor* and some uncommon leaf and ground beetles. Other noteworthy animals include three very scarce damselflies, the spider *Araneus redii* and the Silky Snail *Ashfordia granulata*.

MINERAL EVALUATION BOREHOLES IN THE PORTLAND LIMESTONE

<u>Depth</u> (Metres)	Description
<u>BH1/93</u>	
0 to 0.5	Made ground
0.5 to 3.46	Light grey fine grained non-porous limestone. Some fossils.
3.46 to 12.09	Light grey medium grained slightly porous limestone. Abundant fossils to common <u>chert bands.</u>
12.09 to 19.76	Pale grey and pale brown fine grained slightly porous oolitic limestone.
19.76 to 32.05	Pale brown fine grained porous oolitic limestone and pale grey non porous crystalline limestone. Thinly bedded.
32.05 to 36.28	Light brown muddy limestone in hard crystalline limestone. Thinly bedded.
36.28 to 41.00	Light brown muddy limestone with hard crystalline limestone.
41.00 to 42.08	Light to very dark grey calcerous mudstone.
	• _

:,

ι.

End of borehole 42.08m.

.

Depth (Metres)	Description
<u>BH2/93</u>	
0.0 to 0.7	Made ground.
0.7 to 9.5	Light grey fine grained non-porous limestone.
9.5 to 13.4	Pale grey fine/medium grained porous oolitic limestone.
13.4 to 24.5	Pale grey fine grained porous limestone with common chert bands - thinly bedded.
24.5 to 33.70	Interbedded pale grey crystalline limestone and pale brown porous granular limestone.
33.70 to 36.50	Pale grey to mid grey muddy limestone/calcerous mudstone.
End of borehole 36.50m.	

···

.

.

· .

Depth (Metres)	Description
<u>BH3/93</u>	
0 to 3.24	Buff brown, grey predominantly medium grained oolitic limestone, thinly bedded with occasional thin bands of finer grained - darker grey chert and muddy limestone. 2.05 - 2.15m, laminated brown soft shaley, mudstone band.
3.24 to 6.54	Buff browny grey, homogenous, fine grained, micritic limestone medium bedded with moderately spaced joints at 45 degrees. Joint surfaces moderately weathered, rough with some iron staining, syolitic texture common throughout.
6.54 to 20.38	Buff, creamy brown, relatively homogenous, limestone commonly well bedded, with at vertical joints to 60 degrees, widely spaced. Sparite infill. Darker clay beds from 11.74 - 12.50 and 18.90 - 19.18m
20.38 to 28.24	INTERBEDDED fine oolitic limestone with grey chert bands. Predominantly buff, browny cream, fine grained hard oolitic limestone interbedded with medium grey, very fine crystalline cherty limestone beds, very hard. Surface medium bedded throughout with thin sandy laminations from 24.53m. Jointing widely spaced, sub vertical with brown coating on joint surfaces.
28.24 to 32.04	Buff, grey, fine grained occasionally medium, massively bedded, hard, oolitic limestone with common bivalves and some fossil debris, core has medium to closely spaced joints, sub vertical to 45 degrees with sandy coating on weathered joints.
32.04 to 40.56	Interbedded predominantly fine grained crystalline limestone with grey muddy limestone bands. Interbedded with fine grained crystalline, lighter grey blocks; medium bedded with widely spaced, sub vertical joints, less common set at 45 degrees. 37.76m medium to fine grained oolitic limestone with closely spaced joints.
40.56 to 43.05	Medium grey oolitic, fine grained, soft calcareous silty mudstone. Bedding medium with more closely spaced joints, commonly at 45 degrees, oolitic.
End of borehole 43.05m.	

· ·

..

Depth (Metres)	Description
<u>BH4/93</u>	
0 to 0.87	Made ground.
0.87 to 4.96	Buff grey, medium grained, slightly porous oolitic limestone, predominantly medium bedded, with widely spaced joints at 43 degrees, commonly moderately weathered with clay veneer. 1.80 - 2.21 medium grey crystalline hard chert bands with calcite sparite infilling and crystallisation. 3.90 - 3.93 - clay infill of joints, brown, soft clay.
4.96 - 10.19	Very clayey. Broken limestone.
	Buff brown, fine grained, variable, medium to finely bedded oolitic limestone interbedded with medium grey cherty bands with frequent closely spaced joints. Joints are rough, commonly high angled, sub vertical, filled with orange brown friable soft-firm clay rock. Clay infill up to 10cm's thickness. Broken and recemented clastic limestone beds common from 7.88 also clay bands. Sub vertical, clay infilled joints between 9.17 - 10.03m.
10.19 to 15.79	Buff brown, medium grained, slightly porous, medium to massively bedded, relatively fresh, hard oolitic limestone with widely spaced sub vertical and 45 degrees joints, weakened and clay surface joints at 11.30 2mm irregular calcite growth. 11.39 - 11.43m - Clayey bands. Orange brown, dry, friable soft clay.
15.79 to 24.41	Interbedded cherts and limestones.
	Buff creamy brown, oolitic limestone interbedded with clay and chert bands up to 40cm thick. 17.80 -18.30 brown weathered sand. Joints medium spaced, sub vertical and more frequent, 45-70 degrees rough faces, irregular, fresh with mineral growth. 24.20 - 24.41m - Band of recemented clastic fragments.
24.41 to 27.50	Greyish brown, oolitic limestone, and greeny grey, fine grained, medium to thinly bedded silty mud, soft and friable with widely spaced deep orange joints at 45 - 60 degrees. 26.05m rock changes to dark grey, less weathered.
End of borehole 27.50m.

1

e.

r

From (m)	To (m)	Description
0.00	0.18	Dark brown, fine, limey LOAM.
0.18	0.28	Light buff, very fine, limey LOAM, with 10% buff, fine grained Limestone fragments.
0.28	0.90	Variegated, dry, powdery, very stiff CLAY, predominantly buff with pale orange to dark brown laminae. Well defined varve banding. Occasional buff, fine grained Limestone fragments
0.90	1.25	Light grey to buff, fine grained, well cemented, massive, fossiliferous (small crinoids) LIMESTONE. Sub horizontal (5°) bedding, displaying very thin (sub mm) laminae. Rare barren cavities of up to 8 mm diameter.
1.25	3.15	Buff to light grey, extremely fine grained, well sorted, calcitic MUDSTONE. Tight bedding planes at 10° to 15° from the horizontal. Occasional oxidised partings. Common carbonized vegetation (small shard like leaves and roots). Occasional small channel infill with dark grey mudstone.
3.15	3.22	Dark Grey, laminated calcitic MUDSTONE, extremely sharp contact with leucocratic material above and below. Plasticises when wet.
3.22	4.25	Generally buff, occasionally dark grey, crumbly, calcitic MUDSTONE.
4.25	5.78	Predominantly buff to tan yellow, very stiff, plastic, variegated CLAY. Common dark grey to black horizons of up to 10 cm thick. Banding at 20° to 25° from horizontal. Darker material a stiff clay.
5.78	5.94	Light grey to orangy yellow (oxidised), very damp, plastic, soft, slightly silty CLAY. Occasional siltstone nodules of up to 2 mm diameter.
5.94	6.14	Dark grey to black, soft, slightly silty, wet CLAY. Common siltstone nodules.

- 6.14 6.51 Light grey to buff, very well cemented, calcitic SILTSTONE. Predominant closed fracture set observed at 30° from the horizontal. Common black siltstone bands, very thin and discontinuous.
- 6.51 8.43 As above, less well cemented calcitic MUDROCK.
- 8.43 8.79 Buff and dark grey, variegated, interbedded, well cemented, calcitic SILTSTONE and damp, silty, firm CLAY.
- 8.79 8.95 Buff, well rounded SILTSTONE FRAGMENTS (>2 cm) in a buff, wet, soft CLAY matrix.
- 8.95 11.65 Dark grey, laminated (at approx. 5° from the horizontal) coherent, well cemented, calcitic SILTSTONE. 11.00 m: Calcite infilled fracture at 40° from the

horizontal. Calcite appears powdery.

ARGILLACEOUS LIMESTONE.

ð.,

- 11.65 14.65 Buff to medium grey, commonly oxidised orange, firm to stiff, dry, silty CLAY. Well laminated at 30° from the horizontal.
- 14.65 14.90 Buff to light grey, fine grained, well cemented, massive ARGILLACEOUS LIMESTONE.
- 14.90 15.20 Light buff, dry, silty, broken CLAY.
- 15.20 15.78 Buff to light grey, fine grained, well cemented, massive ARGILLACEOUS LIMESTONE.
- 15.78 16.69 Light grey to buff, dry, broken calcitic SILTSTONE. Occasional argillaceous limestone fragments of up to 2 cm diameter.
- 16.69 27.24 Light buff to orangish grey, interbedded, stiff, damp CLAY and dry, coherent calcitic SILTSTONE.
 22.49 22.70: Light grey, coherent, massive, fine grained ARGILLACEOUS LIMESTONE.
 26.05 26.30: Light grey, coherent, massive, fine grained

End of borehole 27.24m.

Swanworth Quarry Worth Matravers, Dorset

Consultation on the Bournmouth, Dorset & Poole Minerals Site Allocation Plan Swanworth Quarry Extension (PK16)

Preliminary Hydrological & Hydrogeological Risk Assessment

16th December 2016

Appendix 4: Greenfield Runoff Rate

Site name:	Swanworth Quarry
Site location:	Nr. Worth Matravers, Dorset

This is an estimation of the greenfield runoff rate limits that are needed to meet normal best practice criteria in line with Environment Agency guidance "Preliminary rainfall runoff management for developments", W5-074/A/TR1/1 rev. E (2012) and the CIRIA SUDS Manual (2007). It is not to be used for detailed design of drainage systems. It is recommended that every drainage scheme uses hydraulic modelling software to finalise volume requirements and design details before drawings are produced.

Greenfield runoff estimation for sites

Site coordinates

Latitude:	50.60738° N
Longitude:	2.05001° W
Reference:	gbyxckg1r73u / 12.97
Date:	2 Dec 2016

Site characteristics

Total site area	12.97	ha
Significant public open space	0	ha
Area positively drained	12.97	ha

Methodology

Greenfield runoff method	IH124
Qbar estimation method	Calculate from SPR and SAAR
SPR estimation method	Calculate from SOIL type
SOIL type	1
HOST class	N/A
SPR	0.10

Hydrological characteristics

	Default	Edited	
SAAR	837	837	mm
M5-60 Rainfall Depth	17	17	mm
ʻr' Ratio M5-60/M5-2 day	0.3	0.3	
FEH/FSR conversion factor	0.76	0.76	
Hydrological region	7	7	
Growth curve factor: 1 year	0.85	0.85	
Growth curve factor: 10 year	1.62	1.62	
Growth curve factor: 30 year	2.3	2.3	
Growth curve factor: 100 year	3.19	3.19	

Greenfield runoff rates	Default	Edited	
Qbar	2.69	2.69	I/s
1 in 1 year	2.28	2.28	l/s
1 in 30 years	6.18	6.18	I/s
1 in 100 years	8.57	8.57	I/s
Please note that a minimum flow of 5 l/s ap	oplies to any s	ite

Introduction

Inappropriate storage and handling of fuels and oils can result in contamination of ground, ground water and surface water.

This procedure covers

Bulk storage of fuels and oils, including waste oil Filling of bulk storage tanks Storage and handling of drums Refuelling operations Procedure for emptying bunded areas Fuel and oil spills

Bulk storage of fuels and oils, including waste oil

- 1. All fuels and oils in bulk shall be kept in bunded storage, the location of which shall be identified on a site plan.
- 2. The walls and floor of storage bunds must be impervious to oil.
- 3. Tank filling points shall be inside the bunded area.
- 4. Delivery lines shall be overhead or, if underground, sleeved.
- 5. Delivery nozzles shall be stored inside the bund and locked when not in use.
- 6. Bund drain valves, where fitted, shall be designed so that they can only be removed by key or hand held tool, except when emptying the bund under controlled conditions.
- 7. All bulk storage tanks shall be appropriately labelled with contents and capacity.
- 8. Spill kits shall be provided close to hand.
- 9. Bunded areas shall be checked weekly for build up of oil residues, rainwater or debris.
- 10. The inside of the bund shall have a line painted to identify when 10% of the capacity has been filled by rainwater etc.

Filling of bulk storage tanks

- 1. A member of site staff must supervise all tank filling operations.
- 2. Storage tank levels must be checked to gauge spare capacity before starting filling operations.
- 3. Check delivery hoses and hose connections for leaks.
- 4. Report spillages and leaks and clean them up promptly, disposing of waste correctly according to the requirements of prevailing regulation(s).

Storage and handling of drums

- 1. All drums and containers used for the storage of fuels and oils, including waste oil, shall be appropriately labelled and kept in designated areas identified on a site plan. This will include temporary storage areas.
- 2. All drums or containers will be kept in bunded storage or on bund trays. This will include temporary storage.
- 3. Where drum taps are fitted these should be secure. The tap should be positioned over a bund tray to collect drips and spillage.

- 4. No drum shall be stored in the open without a drum cap fitted.
- 5. Drums shall be secured when moving them about the site.
- 6. Report spillages and leaks and clean them up promptly.
- 7. Spill kits shall be provided.
- 8. Drum storage areas shall be checked weekly for evidence of poor practice.

Refuelling operations

- 1. The person refuelling the vehicle must be present throughout the entire refuelling operation.
- 2. Check vehicle fuel tank level before starting refuelling operations to gauge how much fuel is required.
- 3. Check delivery hose from the pump / tank to the nozzle for leaks.
- 4. All delivery nozzles shall be fitted with an automatic cut-out to prevent over-filling.
- 5. Ensure delivery nozzle is held upright when moving between storage tank and vehicle.
- 6. Operatives should be prepared to react to any gas oil splashing out whilst re-fuelling.
- 7. Fuel delivery nozzles shall be locked or similarly disabled when not in use.
- 8. Report spillages and leaks and clean them up promptly.

Procedure for emptying bunded areas

- 1. Authority of site management is required before emptying a bund.
- 2. Details of bund emptying shall be recorded and maintained on site.
- 3. If the contents of the bund include floating oil then the water underneath this oil should be carefully pumped out. The remaining oil coated water should be collected and disposed of through a licensed contractor.
- 4. The reason for bund contamination shall be investigated.

Fuel and oil spills

- 1. Any spillage that cannot be cleaned up promptly with a rag or use of a shovel-full of absorbent material must be reported to the site Manager or his designated deputy who will co-ordinate the response and investigate the cause.
- 2. Spills to ground shall be absorbed and prevented from spreading by using absorbent materials such as sand, fines, absorbent mats, paper or cloth.
- 3. Halt the movement of fuel or oil towards a watercourse by creating a barrier in front of it by sand bagging, deployment of absorbent boom or use of 3mm or finer dust.
- 4. If oil enters a watercourse, prevent it spreading by deploying an absorbent boom.
- 5. If spilt oil or fuel leaves the site the Quarry Manager must inform the Environment Agency (EA).
- 6. Contaminated materials from clean-up should be put in an appropriately labelled container and disposed of through a licensed contractor in line with regulatory requirements as stipulated by the EA.
