### 1.1 INTRODUCTION \& BACKGROUND

1.1.1 Parley Cross is a major, signal controlled, crossroads at the junction of the B3073 and the A347 in East Dorset. Both routes carry high volumes of traffic and the convergence of these flows is understood to result in significant traffic congestion especially in the peak hours. West Parley Village Centre is located to the south west of the junction, and currently offers a poor road and traffic dominated urban environment that, in combination with existing congestion issues at the junction, is likely to discourage journeys to be made by walking and cycling.
1.1.2 It is understood that Dorset County Council (DCC) has investigated various options to improve capacity at the junction previously, including the construction of a gyratory system using land to the south east. However, concerns have been raised that such a solution would not be suitable for accommodating pedestrians and cyclists, creating capacity for car travel and providing an attractive route for bus services travelling along both roads. DCC officers are concerned that both the current layout, and the gyratory option, could also lead to community severance between the proposed residential site to the south east of the crossroads.
1.1.3 Policies FWP5, FWP6 and FWP7 of the draft East Dorset Core Strategy PreSubmission April 2012 provides for changes to the Parley Cross junction and the associated service roads, taking advantage of new link roads that could be provided through adjacent land allocated for development. This in turn could allow for a reduction in the total road area at the existing junction and provide an opportunity to significantly enhance the public realm around Parley Cross, improve accessibility for pedestrians, cyclists and public transport and reduce congestion for vehicles. The draft Core Strategy has been subject to public consultation although the adoption of these policies is yet to be resolved.
1.1.4 The B3073 Corridor Study completed in June 2011 by Buro Happold examined the potential traffic impacts of future development in the Bournemouth Airport Aviation Business Park on Parley Cross and other junctions in the area. The study considered the benefits of providing a link road through development land to the south east of the junction which would facilitate the removal of left turning traffic from the Christchurch Road (E) approach and right turning traffic from New Road (S) approach. As well as background traffic growth to 2020, the study also considered the potential impacts of residential
development on land to the south east and south west of Parley Cross. The Buro Happold report concluded that the expected traffic generated from the proposed West Parley housing developments could be accommodated in both the 2020 AM and PM peak periods.

### 1.1.5 This Technical Note summarises the subsequent work that has been completed

 to examine the benefits of introducing a link road through the development site to the south west of Parley Cross, and the subsequent improvements for sustainable modes resulting from the removal of further turning traffic from the junction. This includes the following:- Traffic modelling to determine the impact of removing diverted traffic from Parley Cross and establish the capacity benefits that could be created by diverting traffic along the development link roads and the potential for traffic lanes to be reduced at the junction.
- Developing a preliminary highway layout for improvements to the junction appreciating the following aims:
- Increased priority for cyclists and pedestrians
- Introduction of new cycleways
- Introduction of increased footway provision.
- Introduction of new bus lanes/priority measures to facilitate express high frequency bus services
- Provision of high quality bus waiting facilities
- Improved links across the New Road carriageway between the development and the existing shopping parade to reduce community severance.
- Provision of a high quality public realm.

### 1.2 TRAFFIC MODELLING

Traffic Inputs
1.2.1 The LINSIG traffic model established by Buro Happold for the B3073 Corridor Study was used as the basis for the 2012 modelling detailed in this Technical Note. This included the residential trip generation for both the east and west development sites, as well as assumed layouts for the Parley Cross junction and the auxiliary junctions at either end of the eastern link road on Christchurch Road (E) and New Road (S).
1.2.2 Following a review of the Buro Happold Report, it was established that the LINSIG model built and tested to assess the residential development and associated link road through the eastern site had not made any allowance for development at the airport. Amended baseline traffic flows were therefore calculated appreciating additional traffic from the committed development of 42,000 sqm of employment. In terms of additional movements through Parley Cross, this equates to an additional 96 movements in the AM peak and 101 movements in the PM peak.
1.2.3 Estimated trip generation for the proposed 3000 sqm food store on the east site was also included in the analysis. Using a TRICS based assessment, and allowing for $30 \%$ of journeys to be pass-by trips from existing traffic on the network, this equates to an additional 142 movements in the AM and 326 in the PM.
1.2.4 In total, this equates to an additional 238 movements in the AM and 427 in the PM peak over and above the levels of traffic analysed in the Buro Happold Study. Copies of the calculations are attached to this report for information.

## Highway Network \& Model

1.2.5 An initial review of the Buro Happold LINSIG model for the Parley Cross network identified an issue with the representation of the southbound approach to the junction. This involved the right turn into Christchurch Road [E] being modelled as an unopposed movement, despite the signal staging having both the northbound and southbound approaches running concurrently. Under this staging, right turning traffic would be required to give way and therefore the original model is likely to have over-estimated the capacity at the junction. An amended version of the LINSIG model updated to appreciate these movements was therefore constructed, with further changes to the signal staging also incorporated to maximise the capacity of the resulting arrangement. Table 1 below summarises the results of the updated model, together with the original results reported in the B3073 Study (Table 6.3):

| Scenario | AM |  | PM |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Lowest Practical Reserve Capacity (PRC) \% |  | Lowest Practical Reserve Capacity (PRC) \% |  |
|  | Original BH Results | Corrected Results | Original BH Results | Corrected Results |
| 2020 Base + Committed Dev | +9.6\% | n/c | +7.8\% | +4.7\% |
| 2020 Base + Committed + 110,000sqm development | +7.7\% | +3.3\% | +3.1\% | -2.9\% |
| 2020 Base + Committed + 137,000sqm development | +5.0\% | -1.7\% | +2.1\% | -5.6\% |
| 2020 Base + Committed + 208,000sqm development | -0.7\% | -5.6\% | -6.9\% | -22.6\% |

1.2.6 Discussions with Matthew Williams of DCC's traffic signal team established that that in this case it would be appropriate to use RR67 as a point of reference in order to calculate saturation flows for the various approaches to the junctions rather than the generic factor applied throughout the original B3073 study model. This enables a better reflection of the effects of lane width, turning radii etc to be appreciated in order to obtain a more realistic representation of the capacity of the junction. The application of this alternative methodology resulted in an improvement in the modelling results for the junction.
1.2.7 The LINSIG model was then adapted further to include a link road through the western residential site and remove the associated turning traffic from the Parley Cross junction (i.e. the right turn from Christchurch Road [W] to New Road [S] and vice versa). For the purposes of this exercise is was assumed that the junctions at either end of the additional link road replicate the auxiliary junctions included in the Buro Happold Report for the eastern link road.
1.2.8 During the verification process, a second issue was identified with the original study model relating to the routing of traffic through the combined network and the relative attractiveness of travelling along the new link roads through the site. This resulted in some traffic travelling from Christchurch Road [E] to New Road [N] that historically would simply turn right at the Parley Cross junction (and be likely to continue to do so in the future), instead being routed through the eastern residential site to New Road [S] and then north straight on through Parley Cross to New Road [ N ]. Clearly this lengthy diversion route is unlikely to reflect the future travel patterns, and results in an over-inflated traffic flow on the New Road [S] approach whilst potentially underestimating right turning movements from the

Christchurch [E] approach (which would have a significant influence on the capacity results). This issue also appeared to be replicated in the reverse direction.
1.2.9 An amended network model was therefore created to remove this routing option and re-assign the traffic flows across the amended network. It was then necessary to extract the Parley Cross junction from the combined network for testing in a stand-alone junction model so that the left/right turning movements at Parley Cross that it is known could be rerouted via the new link roads could be excluded from the modelling manually.

Results

- Scenario 1 - Buro Happold Proposed Layout for Parley Cross + eastern resi link road + western resi link road:
1.2.10 The results of the new stand-alone model for Parley Cross confirm that the introduction of the link roads improves the performance in capacity terms. The increases in saturation flows that were introduced also improve capacity further. However, the addition of committed development from the airport (only some of which benefits from the new link roads), new development trips from the food store (which is a significant factor), and the amendment of the original model to appreciate the blocking of right turning traffic on the southbound approach offsets some of the improvements to capacity that are gained. The Practical Reserve Capacity in this scenario is around $+12 \%$ in the AM and $+7 \%$ in the PM.
- Scenario 2 - Single Lane Approaches on New Road North \& South
1.2.11 Opportunities were then examined to reduce traffic lanes on each approach whilst maintaining the junction working within reasonable operational criteria. The results from Scenario 1 indicate that the demand from the New Road [S] approach (adjacent to the existing neighbourhood centre) does not have a critical impact on the operation of the junction and so this has been the starting point when looking at options to reduce lanes.
1.2.12 An iterative process was followed to examine various options, but the solution emerging from this exercise that fully utilises the Practical Reserve Capacity is set out in Table 2 as follows:

|  | Before (Buro Happold Study) |  | After (WSP Results) |  | Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Entry | No. Lanes | Entry | No. Lanes |  |
| Christchurch Road [E] | - Ahead <br> - Ahead <br> - Right | 3 | - Ahead <br> - Ahead <br> - Right | 3 | n/c |
| New Road [S] | - Ahead/left <br> - Ahead | 2 | - Ahead | 1 | -1 |
| Christchurch Road [W] | - Ahead/left <br> - Ahead/Right | 2 | - Ahead/left <br> - Ahead | 2 | n/c |
| New Road [N] | - Ahead/left <br> - Ahead/Right | 2 | - Ahead/left/right | 1 | -1 |
|  |  |  |  |  |  |
|  | Exit | No. Lanes | Exit | No. Lanes |  |
| Christchurch Road [E] | Merge/ahead | 2 | Merge/ahead | 2 | n/c |
| New Road [S] | Ahead/merge | 2 | Ahead | 1 | -1 |
| Christchurch Road [W] | Ahead/merge | 2 | Ahead/merge | 2 | n/c |
| New Road [N] | Ahead/merge | 2 | Ahead | 1 | -1 |

1.2.13 The resulting layout therefore comprises a reduction in lanes on both of the New Road approaches from 4 to 2 (i.e. one on each entry and one on each exit). This would therefore enable the pedestrian realm to be extended and the crossing distance on the south approach (near the shops) to be reduced. It was found that the arrangement of traffic lanes on the Christchurch Road approaches needs to replicate the proposed arrangement included in the B3073 Study. The Practical Reserve Capacity in this scenario is $+1 \%$ in the AM and $+0.5 \%$ in the PM .
1.2.14 During this process it was found that slightly different signal staging for the AM and PM peak periods enabled the throughput of traffic at the junction to be maximised in order to achieve these results. The worst-case queuing in this scenario occurs during the PM peak on the New Road [ N ] approach, with 27 vehicles in a single file queue in the one approach lane remaining. However, this was found to clear every cycle. A copy of the LINSIG report for this scenario is attached to this Technical Note for information.

- Scenario 3 - Single Lane Approach on New Road [S] and Dual Lane Approach on New Road [ N ]
1.2.15 A refinement of Scenario 2 was tested by re-introducing a dedicated left turn lane on the New Road [ N$]$ approach to increase the capacity, reduce the length of queuing, and provide more space to accommodate that queuing over a shorter distance. This would limit the potential for improved public realm on the approach, but as this arm does not currently have pedestrian crossing facilities (and the signal staging makes it difficult to introduce new ones) this may not be an issue. When this additional option was tested (with the same cycle time as Scenario 2) it was confirmed that the Practical Reserve Capacity in this scenario is $+18.5 \%$ in the AM and $+14.4 \%$ in the PM, with the maximum queue on the north approach reduced to 16 in the PM peak. Therefore Scenario 3 was found to provide more theoretical capacity, slightly less queuing, but less scope to improve pedestrian conditions on the north arm. Simplified signal staging in this scenario also provides an improvement to the operation of the junction. A copy of the LINSIG report for this option is also attached to this Technical Note.
- Scenario 4 - As Scenario 3, but with Single Lane Approach for Christchurch Rd [W]
1.2.16 Scenario 4 was created to test the impacts of reducing the number of traffic lanes on the Christchurch Road [W] approach to reduce the distance pedestrians are required to cross the road. He results found that if the two lanes are reduced to one, capacity is reduced to around $-7 \%$ and queuing is increased to over 25 vehicles in a single lane.
- Scenario 5 - As Scenario 3; but with All-red Phase for Pedestrian Movements
1.2.17 As an alternative method of improving pedestrian accessibility at Christchurch Road, two further options were tested to improve pedestrian movements within the signalling of the junction as it stands. The proposed junction arrangement supplied examined in the B3073 Study includes staggered pedestrian crossings for the Christchurch Road approaches, with separate staging of each leg of the crossing within each cycle. From the perspective of a pedestrian, it might be considered more desirable to cross an arm of the junction in one movement, rather than having to stop and wait within a pedestrian refuge at the half way point.
1.2.18 Given this, the impacts of simplifying the staging of the pedestrian crossings and removing the lost time associated with each individual inter-green were tested by introducing a new all-red stage where all vehicular traffic is stopped and all pedestrian crossings run together. As well as allowing pedestrians to cross each arm in one movement, it would also open up the opportunity to provide new diagonal pedestrian crossings (similar to the recent improvement scheme at Oxford Circus in London) enabling some pedestrian
movements to be combined into one passage across the junction rather than two, thereby minimising pedestrian delay and reducing the perception of severance.
1.2.19 The results for Scenario 5 suggest that a Practical Reserve Capacity of $-4.3 \%$ is achievable in the AM peak and $+0.2 \%$. In terms of queuing, the results suggest this could be in the order of 23 in the AM peak and 27 in the PM peak, split across the two approach lanes. Although the AM result presented a negative figure for PRC, it should be noted that the utilisation of the junction remains below $100 \%$ with the greatest saturation on the Christchurch Road approaches at $93.8 \%$ in the AM peak (with queuing on the west and east approaches of 26 and 24 respectively - again split across two lanes). Given this, and the benefits made to pedestrian accessibility in this scenario, it is considered that the results for traffic capacity could be acceptable.

## - Combined Network Results

1.2.20 As described above, during the modelling process it was necessary to extract the Parley Cross junction from the combined network for testing in a stand-alone junction model to remove the possibility of inaccurate routing through the wider network encompassing the four auxiliary junctions. In order to assess the performance of the auxiliary junctions, an adapted version of the original wider area model was also tested. This adaptation removed the constraint at Parley Cross to ensure that the model did not automatically assign flows inappropriately on a delay basis via the development link roads. For the purposes of this exercise the adapted model does not, therefore, contain the same layout as that included in scenario 5.
1.2.21 Given the distance of the auxiliary junctions from Parley Cross, the interaction of traffic flows and the potential impacts of platooning are considered to be low, and the methodology of testing the auxiliary junctions in isolation without the preferred Parley Cross scenario is considered to provide a reasonable representation of their potential performance.
1.2.22 The layouts assumed for the auxiliary junctions during this modelling process broadly replicate those considered in the B3073 Study, although it has been necessary to include a second ahead lane on the Christchurch Road (E) approach to Junction 2. The configurations and results for Practical Reserve Capacity are summarised in the Tables below:

| Auxiliary Junction 2 - East of Parley Cross |  |  |  |
| :---: | :---: | :---: | :---: |
|  | Christchurch Road (W) | Development Link Road | Christchurch Road (E) |
| Lanes | $\begin{array}{ll} \hline & \text { Ahead } \\ \text { Right } \end{array}$ | - Left <br> - Right | - Ahead <br> - Ahead <br> - Left |
| AM PRC = -5.6\% |  | PM PRC = +10.0\% |  |

| Auxiliary Junction 3 - South of Parley Cross (Eastern Development Link Road) |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | New Road (N) | Development Link Road | New Road (S) |
| Lanes | $\boxed{\text { Ahead/left }}$ | $\boxed{\square}$Left <br> Right | Ahead    <br>     <br> AM PRC $=+37.6 \%$  PM PRC $=+8.1 \%$ Right |

## Auxiliary Junction 4 - West of Parley Cross

|  | Christchurch Road (W) | Development Link Road | Christchurch Road (E) |
| :--- | :--- | :--- | :--- |
| Lanes | $\square$Ahead <br> Right | $\boxed{\text { Left/right }}$ | Ahead/left |
| AM PRC $=+21.9 \%$ | PM PRC $=+5.1 \%$ |  |  |

Auxiliary Junction 5 - South of Parley Cross (Western Development Link Road)

|  | New Road (N) | Development Link Road | New Road (S) |
| :---: | :---: | :---: | :---: |
| Lanes | $\begin{array}{ll} \text { - } & \text { Ahead } \\ \text { Right } \end{array}$ | - Left/right | $\begin{array}{ll} \text { Ahead } \\ & \text { Left } \end{array}$ |
| AM PRC = -0.2\% |  | PM PRC = -3.5\% |  |

1.2.23 As summarised above, the assumed layouts for the auxiliary junctions are anticipated to operate below $100 \%$ utilisation. Although at this feasibility stage the results for some junctions suggest small negative values of PRC, it is considered likely that the small change required to achieve a positive PRC could be achieved through the detailed design and modelling process for each site.
1.2.24 Increases in capacity could also be achieved through the introduction of a MOVA system (Microprocessor Optimised Vehicle Actuation) at the junctions. The system generates optimised signal timings cycle-by-cycle, varying continuously with traffic conditions and the volume of vehicles that are detected arriving at the junction.
TRL/Department of Transport (DOT) trials have shown that the use of MOVA reduces delays by an average of $13 \%$.
1.2.25 Given the results of this initial feasibility assessment, it is considered likely that the network as a whole would operate within reasonable performance criteria. It should be noted that this assessment of the auxiliary junctions focusses on potential capacity only given the anticipated traffic flows at this time. Final design solutions would need to be investigated in detail by the respective developers as part of the planning process, both in terms of geometry and capacity, given the development mix that is ultimately pursued.

## Summary

1.2.26 As explained above, Scenario 2 provides the greatest scope for reducing vehicle lanes (to leave a single entry and exit on each New Road arm), and although it achieves Practical Reserve Capacity results within criteria normally considered to be acceptable it was found to generate some potentially significant vehicle queuing on the New Road ( N ) approach. This could be mitigated by re-introducing a left turn lane on the approach (Scenario 3), although this would then reduce the scope of improvements that could be made for pedestrians at this location.
1.2.27 An adaptation of Scenario 3 would be to include an all-red phase at the junction to allow pedestrians to cross each arm in one movement. This Scenario 5 would also provide the option of introducing diagonal crossings to enhance pedestrian accessibility in the neighbourhood. Although this would result in greater lost time at the junction for vehicle movements and reduce reserve capacity when compared with Scenario 3, the benefits to sustainable modes could potentially outweigh the decrease in traffic capacity.

### 1.3 PRELIMINARY HIGHWAY LAYOUT

1.3.1 Following the completion of the traffic modelling stage, a design workshop was held on Friday 10 February 2012 with Dorset County Council officers to discuss the constraints and opportunities associated with delivering highway improvements at the Parley Cross junction. Following that meeting, a preliminary highway layout was produced based on the reduced carriageway space defined through the modelling exercise (Scenario 5) and the aspiration for improvements to sustainable transport infrastructure discussed at the workshop session.
1.3.2 The layout is shown on Figure 31567/SK-01/B which is attached to this report. The indicative scheme shown for the eastern development site was produced by Wyatt Homes and provided by Dorset County Council to provide context to the Parley Cross works. The main features of the proposed highway scheme are summarised below:

- Two vehicle lanes on the Christchurch Road [E] approach, with left turns banned.
- Two vehicle lanes on the Christchurch Road [W] approach, with right turns banned.
- Two vehicle lanes on the New Road [ N ] approach, with all movements permitted.
- Single vehicle lane on the New Road [S] approach, with left and right turns banned.
- Kerb line brought forward at north-east corner to create additional footway space where it is currently fairly tight for pedestrians. The new position has been defined by the swept path of an HGV/bus turning left from New Road to Christchurch Road.
- Stop lines on all approaches brought forward to reduce lost time within each cycle of the traffic signals.
- Diagonal pedestrian crossings introduced, with fixed bollards provided at the New Road [ N ] approach where there is a significant length of dropped kerbs at the junction radii and there could be a potential risk to waiting pedestrians from larger vehicles overrunning.
- All crossings shown are 3 m wide and intended to be toucan crossings (i.e. for pedestrians and cyclists)
- 3 m shared footway cycleway on the south side of Christchurch Road [E].
- Cycle "off-slip" from the carriageway on each approach to the adjacent shared footway/cycleway.
- 3 m shared footway/cycleways on either side of New Road [S]
- The existing exit only junction with the service road to the west of New Road [S] (by "The Lighting Studio") closed, and new half lay-by bus stop provided instead close to the main shops.
- New half lay-by bus stop on the east/southbound side of New Road [S] approximately in the same location as existing.
- The bus lay-bys shown are 2 m wide with 3 m bus cage markings. Although there should still be sufficient space for two cars to pass along New Road if both bus stops are occupied, there is a risk that through traffic could be obstructed for a short period of time. However, this arrangement should afford better priority to buses pulling out into the stream of traffic.
- At least 4 m of pedestrian realm adjacent to each bus stop to accommodate bus shelters without blocking through pedestrian/cycle movements.
- New uncontrolled pedestrian crossing with central refuge island on New Road [S] approx. 35m north of retained access into service road at Parley Cross Pharmacy.
- Existing service road north of retained access/egress converted to shared space. Colours shown on the drawing show where different surfacing materials could be employed to break up the shared space into a series of defined areas, as well as highlight linkages from the key pedestrian, cycle and public transport connections surrounding the local centre. A 3m zone immediately adjacent to the building frontages is demarcated either with parking bays or a row of road marking studs to subtly discourage traffic whilst still retaining the visual appearance of shared space through the use of the same surfacing materials. As well as creating a zone for pedestrians to safely emerge from the shop units, this could also aid the visually impaired to navigate through the space.
- The alignment of New Road [S] has been amended to create more space within the neighbourhood centre shared space. The existing parking configuration at the neighbourhood centre has been revised to create a varied alignment for traffic passing through the area to heighten driver awareness/risk compensation and reduce speeds. The rows of parking bays are broken up with some areas of landscaping to try and reduce its dominance. The revised car park accommodates 32 parking bays and therefore retains the existing capacity.
- Potential locations for cycle parking within the neighbourhood centre are also indicated, which could be useful as a "park \& ride" facility for cyclists when bus services along the corridor are improved in the future.
- The northern end of the service road (near the co-op) has been arranged to allow a large car and 4.6T light van to perform a three-point turn, although to improve the quality of the space this is not demarcated on the ground as a formal turning head. It would, however, provide a facility for any "lost" traffic (or vehicles using the parking bays that are not arranged at 90 degrees) to turn around and return to the vehicle egress.
- It has been assumed that the existing vehicular route through the adjacent private car park (near the public conveniences) would be closed to through traffic as discussed at the workshop. However, this could be retained if required with the loss of one parking bay.

### 1.4 SUMMARY \& CONCLUSIONS

1.4.1 Parley Cross is a major signal controlled crossroads at the junction of the B3073 and the A347 in East Dorset. West Parley Village Centre is located to the south west of the junction, and currently offers a poor road and traffic dominated urban environment that, in combination with existing congestion issues at the junction, is likely to discourage journeys to be made by walking and cycling. It is understood that DCC officers are concerned that both the current layout, and the potential traffic based solutions that have been investigated to date, could also lead to greater community severance.
1.4.2 Land to the east and west of Parley Cross is allocated in the draft East Dorset Core Strategy for predominantly residential development which could provide the opportunity for new link roads to be delivered, enabling the removal of existing traffic movements from Parley Cross to help alleviate the congestion issues. This in turn could allow for a reduction in the total road area at the existing junction and provide an opportunity to significantly enhance the public realm.
1.4.3 Traffic modelling of the junction and eastern link road was undertaken as part of the B3073 study, and this 2012 study builds upon that earlier work to assess the impact of providing a new link road through the western development site. Refinements to the LINSIG model structure and development traffic flows have been made during this exercise.
1.4.4 An iterative process was followed to examine various options, but the solution emerging from the modelling exercise that provides the greatest scope for reducing vehicle lanes and fully utilising the Practical Reserve Capacity results in a single entry on the New Road [S] arm and two lane entries on the other approaches. An adaptation of this scenario would be to include an all-red phase at the junction to allow pedestrians to cross each arm in one movement. This would also provide the option of introducing diagonal crossings to enhance pedestrian accessibility in the neighbourhood. Although the add-red phase would result in greater lost time at the junction for vehicle movements, the benefits to sustainable modes could potentially outweigh the decrease in traffic capacity.
1.4.5 Following the completion of the traffic modelling stage, a design workshop was held with Dorset County Council officers to discuss the constraints and opportunities associated with delivering highway improvements at the Parley Cross junction. A preliminary highway layout was then produced based on the reduced carriageway space defined through the modelling exercise and the aspiration for improvements to sustainable transport infrastructure discussed at the workshop session. The potential scheme, shown on Figure 31567/SK-01/B, was presented at the public consultation event on 24 April 2012 by Dorset County Council.
1.4.6 In summary, the results of the additional traffic modelling work completed in connection with Parley Cross established that the introduction of new link roads through the proposed development sites could allow the removal of several traffic movements and associated carriageway space at the existing junction which in turn could allow significant improvements to the public realm and pedestrian accessibility to be made. As well as Parley Cross itself, the results of the modelling suggest that the assumed layouts for the auxiliary signal junctions required to connect the development link roads to the highway network at Christchurch Road and New Road (S) are likely to operate within acceptable performance criteria. Based on the results of the modelling exercise, a preliminary highway layout for improvements to Parley Cross has been prepared which takes advantage of the reductions in carriageway space that could be made available to provide a series of improvements for pedestrians, cyclists and public transport.
1.4.7 In conclusion, it is considered that a scheme to introduce link roads through development land to the east and west of Parley Cross has the potential to facilitate improvements to sustainable transport infrastructure at the junction and enhance pedestrian accessibility in the neighbourhood. The feasibility of the indicative highway solutions assumed in this study should be considered at the next level of detail through the planning process to confirm final solutions in terms of geometry and capacity based on the masterplans and development mix that are ultimately pursued.
