This section displays the number of survey days per TRICS® sub-region in the selected set

## Filtering Stage 2 selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

| Parameter: | Number of dwellings |
| :--- | :--- |
| Actual Range: | 14 to 85 (units: ) |
| Range Selected by User: | 6 to 100 (units: ) |

Public Transport Provision:
Selection by: Include all surveys
Date Range: $\quad 01 / 01 / 06$ to $24 / 10 / 13$
This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

| Monday | 3 days |
| :--- | :--- |
| Tuesday | 3 days |
| Wednesday | 1 days |
| Thursday | 2 days |
| Friday | 1 days |

This data displays the number of selected surveys by day of the week.
Selected survey types:

| Manual count | 10 days |
| :--- | ---: |
| Directional ATC Count | 0 days |

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:
Edge of Town Centre 1
Suburban Area (PPS6 Out of Centre) 3
Edge of Town 6
This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

## Filtering Stage $\mathbf{3}$ selection:

## Use Class:

C3 10 days
This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 1 mile:

| 1,001 to 5,000 | 2 days |
| :--- | :--- |
| 5,001 to 10,000 | 5 days |
| 10,001 to 15,000 | 3 days |

This data displays the number of selected surveys within stated 1-mile radii of population.
Population within 5 miles:

```
5,001 to 25,000 3 days
25,001 to 50,000 6 days
50,001 to 75,000 1 days
```

This data displays the number of selected surveys within stated 5 -mile radii of population.

## Car ownership within 5 miles:

| 0.6 to 1.0 | 5 days |
| :--- | :--- |
| 1.1 to 1.5 | 4 days |
| 1.6 to 2.0 | 1 days |

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5 -miles of selected survey sites.

Travel Plan:
No
10 days
This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

This section provides a list of all survey sites and days in the selected set. For each individual survey site, it displays a unique site reference code and site address, the selected trip rate calculation parameter and its value, the day of the week and date of each survey, and whether the survey was a manual classified count or an ATC count.

| Total Rates: |  |  | 2.399 |  |  | 2.424 |  |  | 4.823 |

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

## Parameter summary

Trip rate parameter range selected:
Survey date date range:
Number of weekdays (Monday-Friday):
Number of Saturdays:
Number of Sundays:
Surveys manually removed from selection:

14-85 (units: )
01/01/06-24/10/13
10
0
0
0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

| 23:00-24:00 |  |  |  |  |  |  |  |  |  |
| Total Rates: |  |  | 0.014 |  |  | 0.014 |  |  | 0.028 |

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

## Parameter summary

Trip rate parameter range selected:
Survey date date range:
Number of weekdays (Monday-Friday):
Number of Saturdays:
Number of Sundays:
Surveys manually removed from selection:

14-85 (units: )
01/01/06-24/10/13
10
0
0
0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

| 20:00-21:00 |  |  |  |  |  |  |  |  |  |
| 21:00-22:00 |  |  |  |  |  |  |  |  |  |
| 22:00-23:00 |  |  |  |  |  |  |  |  |  |
| 23:00-24:00 |  |  |  |  |  |  |  |  |  |
| Total Rates: |  |  | 0.044 |  |  | 0.042 |  |  | 0.086 |

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

0
0
0

This section displays a quick summary of some of the data filtering selections made by the TRICS ${ }^{\circledR}$ user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

| Total Rates: |  |  | 0.000 |  |  | 0.002 |  |  | 0.002 |

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.

## APPENDIX G

FRAMEWORK CONSTRUCTION TRAFFIC MANAGEMENT PLAN

# HOLLYMOOR LANE, <br> BEAMINSTER, DORSET <br> FRAMEWORK CONSTRUCTION MANAGEMENT PLAN 

## Proposed Planning Condition

1.1 Full construction details such as phasing, materials to be removed, number of construction vehicles etc have not been finalised at this stage of planning. The developer is willing to accept a planning condition to prepare a full Construction Traffic Management Plan (CTMP). The suggested condition is given below:
"The construction of the development shall not commence until there has been submitted to and approved in writing by the local planning authority a Construction Management Plan. The plan shall include construction vehicle movements, construction operation hours, construction vehicular routes to and from site, construction delivery hours, expected number of construction vehicles per day, car parking for contractors, specific measures to be adopted to mitigate construction impacts in pursuance of the Environmental Code of Construction Practice. The development plan shall be carried out in strict accordance with the approved traffic management plan."
1.2 Regardless of the above condition, an outline CTMP is given below.

## Construction Site Access

1.3 The primary access method for construction traffic will be by road via the existing highway network. Construction traffic will be directed to use the primary road network, namely the A3066 Bridport Road, the B3163 Whitcombe Road, East Street and Hollymoor Lane.
1.4 Construction access to the site will be taken from Hollymoor Lane via the proposed site access.

## Construction Phasing

1.5 Construction of the Hollymoor Lane site is anticipated to be completed in one phase.

## Hours of Working

1.6 No construction works will be carried out on Sundays or Bank Holidays.
1.7 In order to maintain these working hours, the Contractor(s) may require a period of up to half an hour before and up to one hour after normal working hours for preparation and close down activities. This will not include operation of plant or machinery.
1.8 In exceptional circumstances, for safety and operational reasons, it may be necessary to work outside of these hours. Where this occurs, the hours and duration of work will be subject to consultation with the Local Authority and kept to a minimum.

## Traffic Management Principles

1.9 In order to construct the proposed development it is important that construction traffic and traffic on the existing highway network are managed to maximise construction efficiency and safety while minimising risk, inconvenience and nuisance to the public. This will be achieved through careful management, programming and co-ordination of all works on the existing highway network and traffic accessing the site, including residential traffic associated with initial occupations.
1.10 To minimise the impact of construction traffic on the existing road network the following construction traffic management principles will be observed:

* All construction works on the existing highway network will be planned around the peak hours with unimpeded access to the network given to the public during peak hours whenever possible and safe to do so;
* Strict delivery times - (As stated at the outset and agreed via Prestart contractor meetings);
* The main access routes to and from the site will be signed and approved by the Local Authority with all contractors and suppliers to the site being advised of the routes. Appropriate signage to be installed prior to full start on site;
* The safety of the public and the contractor's work force is paramount therefore temporary road closures will be sought if there is a health and safety risk to either the public or the work force on the public highway;
* The number, duration and length of any road closures or diversions will be kept to a minimum;
* Large numbers of access points and repetitive diversions and closures will be avoided to reduce the risk of driver error and confusion;
* All traffic management proposals will be free running where safe to do so (i.e. the use of temporary traffic signals will be kept to a minimum) while also operating under the existing and proposed traffic regulation orders and general directions wherever possible;
* To minimise the impact that the construction works will have on the local residents and surrounding environment, the contractor will appoint a delivery and transportation manager;
* The delivery and transportation manager will be responsible for ensuring all construction and delivery vehicles to and from the site are managed efficiently and reduce nuisance or unnecessary disruption to the operation of the existing highway network. The role will also include advising delivery companies and their drivers of the most appropriate route to follow when approaching the site in particular providing advice on local width and weight restrictions;
* Vehicle/engine switch off when not in use.
* To minimise disruption to the existing highway network, the delivery and transportation manager will ensure that deliveries to the site and export of waste from the site are not undertaken during the highway peak hours, namely 07.45 to 09.15 and 16.30 to 18.00 Monday to Friday;
* Drivers of delivery vehicles will be required to contact the delivery and transportation manager or banksman by mobile telephone to advise of approach to the site so that the appropriate access route can be cleared and security gates opened. This will ensure minimal delays to other road traffic;
* To minimise the volume of traffic accessing the site from outside the area, local suppliers and businesses will be used wherever practical and suitable with support from specialised companies and suppliers not located within the area;
* Banksmen will be provided at all access and exit points to the site to ensure that access restrictions to the site are adhered to and that pedestrian/cyclist safety in the vicinity of the access points is ensured at all times. A gate will be erected at
the Hollymoor Lane access to control public pedestrian and vehicular access to the site;
* In the interest of safety and effective management, designated accesses and routes around the site will be well defined so that construction and residential traffic from early occupations are segregated as far as reasonably possible;
* Site speed limits set to 10 mph throughout site compound;
* Emergency access points will be designated and emergency services informed of these locations;
* The Contractor(s) will ensure that the public highway is kept clear of mud and debris through ensuring that loads are suitably sheeted and secured and undertaking regular street cleaning by mechanical brush;
* Road sweeping used on a call out basis to ensure local roads are not adversely affected by our works;
* Controls on parking close to the site, particularly in residential areas;
* DCC will be provided with the telephone contact number of the site delivery and transportation manager so that any issues relating to construction vehicle movements can be quickly addressed;
* DCC will be provided with a brief overview of the anticipated site activities and any 'out of the ordinary' construction vehicle movements via a week by week rolling schedule. This will allow any particular access or routing concerns to be raised in advance; and
* This Construction Traffic Management Plan will be incorporated as part of the overall Health and Safety policy for the site. Any breach of the principles contained within the document by contractors staff or delivery drivers/companies will therefore be subject to a warning with any subsequent breach resulting in a ban from the site.
